

Project: Chance of Admission Prediction

 **** Objective **** To build a machine learning model that predicts the probability of a student getting admitted to a university based on academic and profile features like GRE, TOEFL, CGPA, etc.

 **Data Source** Dataset: Admission Chance CSV (YBI Foundation) [link text](#)

*  **Dataset Overview** * This dataset is designed to help predict a student's likelihood of being accepted into a graduate program based on various academic and profile-related attributes. Each record in the dataset represents an individual applicant and includes the following features:

GRE Score – Graduate Record Examination score, a standardized test often required for graduate admissions.

TOEFL Score – Test of English as a Foreign Language score, assessing English language proficiency.

University Rating – A numerical indicator of the university's quality or prestige (typically rated from 1 to 5).

SOP – Strength of the applicant's Statement of Purpose, rated on a scale.

LOR – Quality of Letters of Recommendation, rated similarly.

CGPA – Cumulative Grade Point Average, measuring overall academic performance.

Research – A binary value (0 or 1) indicating whether the applicant has prior research experience.

Chance of Admit – The target variable representing the estimated probability of admission, ranging between 0 and 1.

This dataset is often used in machine learning tasks related to regression and prediction modeling in educational analytics.

Import Libraries

```
1 # importing the libraries required
2
3 import pandas as pd      # it handles and analyzes structured data
4 import numpy as np       # it is used for numerical operations
5 import matplotlib.pyplot as plt # used to visualize the data
6 import seaborn as sns    # more advanced visualization
7
8 from sklearn.model_selection import train_test_split # it helps in splitting the data into training and test sets
9 from sklearn.linear_model import LinearRegression   # it is a linear regression algorithm
10 from sklearn.metrics import mean_squared_error, r2_score # it evaluates model performance
11
```

Import Data

```
1 url = "https://github.com/ybifoundation/Dataset/raw/main/Admission%20Chance.csv"
2 df = pd.read_csv(url)
```

Describe Data

```
1 # Clean column names
2 df.columns = df.columns.str.strip()
3
4 # Drop unnamed column if it exists
5 df = df.loc[:, ~df.columns.str.contains('^Unnamed')]
6
7 # View first few rows
8 df.head()
```

Prediction

```

1 # Predict on a sample student profile
2 sample = pd.DataFrame({
3     'Serial No': [0], # Add a placeholder for Serial No as it was in the training data
4     'GRE Score': [325],
5     'TOEFL Score': [112],
6     'University Rating': [4],
7     'SOP': [4.5],
8     'LOR': [4],
9     'CGPA': [9.1],
10    'Research': [1]
11 })
12
13 predicted_chance = model.predict(sample)
14 print(f"Predicted Chance of Admission: {predicted_chance[0]:.2f}")

```

Predicted Chance of Admission: 0.80

* **Explanation** * In this project, we used a Linear Regression model to predict a student's chance of admission by looking at key factors like their academic scores and research background.

The results show that features such as CGPA, GRE, and TOEFL scores have a significant impact on the likelihood of getting admitted. These variables are closely linked to the admission chances, meaning they play an important role in the model's predictions.

The R^2 Score helps us understand how well the model captures the relationship between these features and the admission probability. A higher R^2 value means the model does a good job of explaining the variations in the data, giving us confidence in its predictions.
